AUTHOR GUIDELINES

Instructions for authors

The quarterly **Journal of Health Sciences** carries and publishes peer-reviewed scientific original articles, review papers and case studies in all areas of medical and biological sciences from basic research to clinical and experimental study in English.

The Journal aims at establishing itself as the leading international journal in medical and biological sciences. We publish original scientific studies, review and educational articles, and papers commenting on the clinical, scientific, social, political, and economic factors affecting health. The journal will also publish information materials from the national consultants, materials discussing the activities of the medical Clubs, and news from the medical community.

We also accept conference reports, book reviews and letters to the editor. Each submission is subject to review by selected experts in the subject area. The review process is fully anonymous.

Papers should be submitted to the Editorial Office by online system:

<http://journal.rsw.edu.pl/index.php/JHS/login>

Online Submissions

[Go to Login](#)

Need a Username/Password?

[Go to Registration](#)

Registration and login are required to submit items online and to check the status of current submissions.

A cover letter should be included with the manuscript, containing a declaration to the effect that the manuscript has not been previously published or submitted to another journal, signed by all the authors. It should also include written approval from the head of the institution in which the study was conducted.

The text should use a font not smaller than 12 points, and should be double-spaced, with a margin of 2.5 cm on all sides (left, right, top, bottom). The pages should be numbered consecutively.

The **title page** should contain the title of the paper (in English), the full names of the authors, and their full affiliations. At the bottom of the page, the full name, academic degree, and address of the corresponding author should be given (including the telephone number, fax number and/or e-mail address).

The **abstract** (in English) should be 200-250 words in original papers, or up to 150 words in review papers and case studies. The abstract of an original paper should be adequately structured, i.e. contain the following parts: introduction, aim, materials and methods, results and conclusions. Below the abstract, no more than 5 keywords should be given in English in accordance with the Index Medicus (Medical Subject Reading).

The **body text** should be organised as follows:

1) in original papers: introduction and aim, materials and methods, results, discussion and conclusions;

2) in review papers: free structure;

3) in case studies: introduction (motivation for the study), case description, discussion of the characteristic symptoms, treatment results etc.

References. References to the works cited should be placed between square brackets, e.g. [1–4, 10, 14]. Do not use automatic numbering for references. The reference section at the end of the paper should be arranged according to the sequence of citations in the body text. In original and review papers, there should be no more than 100, and in case studies – no more than 50 references. References must only contain published works. References to journal articles should give the surnames and first name initials of the first three authors, followed by "et al." if there are more than three authors, the title of the paper, abbreviated journal title (according to Index Medicus), publication date, volume and issue number, and page numbers. Punctuation should adhere strictly to the example below:

1. Hamano H, Kawa S, Horiuchi A et al. High serum IgG4 concentrations in patients with sclerosing pancreatitis. *N Engl J Med* 2001; 344: 732-8.

2. Pijls NH, De Bruyne B. Coronary pressure. Kluwer Academic Publishers, London 2000.

3. Perri P, Cavaliere F, Boti C i wsp. Epidemiology of gastroenteropancreatic neuroendocrine tumors. In: Update in Neuroendocrinology. Baldelli R, Casanue va FF, Tamburano G (wyd.). Udine Centro UD 2004; 483-512.

Tables and figures. Tables and figures must not be included in the body text; please only indicate where they should appear in the final printed version. Tables should each be placed on separate pages and numbered consecutively using Roman numerals. Tables should be captioned in English, and should be accompanied by adequate explanatory notes.

Figures and photographs should be submitted:

1) as hard copies (numbered using Arabic numerals, and identified using the names of the authors, paper title, and a "top" marking);

2) in one of the following electronic formats: *.cdr, *.tif, *.eps or *.jpg (at a resolution of 300 dpi). Figure captions, in English, should be placed on separate pages. Please do not submit figures in MS Word *.doc files.

When publishing their work, the author(s) should bear in mind the requirements of the Declaration of Helsinki (an international medical ethics act, signed in 1975, which stipulates that it is prohibited to name the patients, give their initials or hospital record numbers). The relevant ethical committee's statement of approval for the study, along with the patients' conscious agreement to participate, should be included in the Materials and Methods section for all papers in which the diagnostic and therapeutic actions do not follow from standard procedures.

For photographs, the patient's written permission to publish must always be obtained.

Please specify the sources of funding for the study (e.g. grants, private sponsors) in a short acknowledgement note below the Discussion section.

Authors of studies presenting results of clinical studies of drugs and medical procedures are expected to describe in detail how the study was financed, what the sponsor's role was in the planning and execution of the study and in the analysis of the results, and what the influence was of the sponsoring institution on the contents of the paper.

Irrespective of the topic of the submission, international drug names should be used in the text.

Abbreviations used in the text should be explained at first mention (this also applies to the abstract). Other than in exceptional situations, abbreviations should not be used in the title of the submission.

The results of laboratory studies and the relevant standards and standard deviations should be expressed using SI units.

The editors shall bear no responsibility for the contents of any advertisements or announcements published.

Authors receive no payment for publishing in *Journal of Health Sciences*. Offprints for authors are not produced.

Upon receiving the proofs, the first author (or one of the co-authors) should clear it for publication within 48 hours by contacting the Publisher by electronic means (or by fax). In case a clearance is not submitted within this deadline, the Publisher will assume that the authors endorse the text as is.

For authors the bibliographic and formatting standards used for items submitted to the journal (e.g., *Publication Manual of the American Psychological Association*, 5th edition, 2001). It is often helpful to provide examples of the common citation formats for journals and books to be used in submissions. Also identify the types of appropriate Supplementary Files (e.g., data-sets, research instruments, etc.) which authors should be encouraged to upload, in addition to their submission, to enhance readers' engagement with their work.

<http://www.icmjie.org>

SUBMISSION PREPARATION CHECKLIST

1. As part of the submission process, authors are required to check off their submission's compliance with all of the following items, and submissions may be returned to authors that do not adhere to these guidelines.

2. The submission is published, nor is it before another journal for consideration (or an explanation has been provided in Comments to the Editor).

3. The submission file is in LibreOffice, OpenOffice, Microsoft Word, RTF, or WordPerfect document file format.

4. Where available, URLs for the references have been provided.

5. The text is single-spaced; uses a 12-point font; employs italics, rather than underlining (except with URL addresses); and all illustrations, figures, and tables are placed within the text at the appropriate points, rather than at the end.

6. The text adheres to the stylistic and bibliographic requirements outlined in the *Author Guidelines*, which is found in About the Journal. To the stylistic and bibliographic requirements outlined by the International Committee of Medical Journal Editors (available at <http://www.icmjie.org>).

7. If submitting to a peer-reviewed section of the journal, the instructions in *Ensuring a Blind Review* have been followed.

8. **Suggest Reviewers**

9. Suggesting 3 reviewers are Required for Submission.

Please suggest potential reviewers for this submission.

Use the fields below to give us contact information for each suggested reviewer, and please provide specific reasons for your suggestion in the comments box for each person. Please note that the editorial office may not use your suggestions, but your help is appreciated and may speed up the selection of appropriate reviewers.

Introduction

We hope that a varied program of the **Journal of Education, Health and Sport formerly Journal of Health Sciences** will answer your expectations. We believe that the **Journal of Education, Health and Sport formerly Journal of Health Sciences** will contribute to raising the knowledge, skills and abilities of doctors, therapists, physiotherapists, nurses, psychologists, biologists, researchers, practitioners and health workers interested in rehabilitation, physiotherapy, tourism and recreation.

Journal of Education, Health and Sport formerly Journal of Health Sciences, corresponding to the modern challenges of global health specialists collect articles from those areas of the leading centers of renowned foreign and domestic. Many of them present state of art in their field. This will be particularly valuable for young doctors in the specialization, and students.

Welcome to familiarize yourself with this issue all relevant hazards and health, life and safety at work in tourism, recreation, rehabilitation, physiotherapy, nursing organization to work safely and missions in these conditions, the influence of environmental conditions on public health.

Authors from abroad and the country will present an overview of contemporary challenges and solutions in these areas. The issue concerns the text of the wider work for human health, tourism, recreation, physiotherapy, nursing, wellness and rehabilitation, including the economics of health care.

Wstęp

Wyrażamy nadzieję, że zróżnicowany program **Journal of Education, Health and Sport formerly Journal of Health Sciences** będzie odpowiadał Państwa oczekiwaniom. Wierzymy, że **Journal of Education, Health and Sport formerly Journal of Health Sciences** przyczyni się do podnoszenia wiedzy, kwalifikacji i umiejętności lekarzy, rehabilitantów, fizjoterapeutów, pielęgniarek, psychologów, biologów, praktyków i badaczy zainteresowanych ochroną zdrowia pracowników rehabilitacji, fizjoterapii, turystyki i rekreacji.

Journal of Education, Health and Sport formerly Journal of Health Sciences, odpowiadająca na współczesne światowe wyzwania zdrowotne, gromadzi artykuły specjalistów z tych dziedzin z wiodących, renomowanych ośrodków zagranicznych i krajowych. Wielu z nich przedstawia state of art w swojej dziedzinie. Będzie to szczególnie cenne dla młodych lekarzy w trakcie specjalizacji, oraz studentów.

Mile widziani do zapoznania się z tą problematyką wszystkich zainteresowanych zagrożeniami i ochroną zdrowia, życia i bezpieczeństwa w pracy w turystyce, rekreacji, rehabilitacji, fizjoterapii, pielęgniarstwie organizacją bezpiecznej pracy i misji w tych warunkach, wpływem warunków środowiska na stan zdrowia publicznego.

Autorzy z zagranicy i kraju przedstawią przegląd współczesnych wyzwań i proponowanych rozwiązań w tych dziedzinach. Problematyka tekstów prac dotyczy szeroko rozumianego zdrowia człowieka, turystyki, rekreacji, fizjoterapii, pielęgniarstwa, odnowy biologicznej i rehabilitacji, również ekonomiki ochrony zdrowia.

Abstract

The main subject of the study of the ecological and medical zoning method is the complex state of the autonomic nervous system (ANS) of the child's organism and the analysis of the processes affecting it. The ANS performs adaptational trophic function - the regulation of the metabolism regarding the conditions of the environment. The analysis of possible ecological problems of the territory and its degree of ecological disturbance can be made due to the received data set on the state of functional health of the children's population of a certain territory and the averaged information on the deviation of the autonomic nervous system. In order to assess the disturbance of the territory, the relative value of the breach of vegetative homeostasis, which is defined as a percentage, is of particular importance. Various organs and systems of the body are known to be associated with certain areas of the skin called acupuncture points. With the appearance of the smallest deviations in the systems of the body and organs, they react at the stage of functional disorders long before the occurrence of organic changes at the expense of meridional bonds. Measuring the electrosurgical resistance in certain acupuncture points you can detect changes in the body still at the stage of

functional disorders. For researches, the method of "biogalvanization" of 24 symmetrical representative active functional zones (12 on the arms and 12 on the legs), which reflect the functional activity of the sympathetic and parasympathetic nervous system has been used. This allows to record changes in the activity of sites of the ANS and to obtain systematic data that are subject to further complex analysis. The given method is unique and allows to conduct ecological analysis of the territory with the help of the target group of organisms - a person; method is non-invasive and low-cost, which allows conducting surveys of different age and sex groups and obtaining data with a minimum statistical error.

Keywords: sympathetic activity; parasympathetic activity; autonomic nervous system; vegetative homeostasis; ecological

Introduction. The problems of preserving the ecosystem and the biosphere as a whole has become more urgent considering the profound transformation of the natural environment, which is carried out under the influence of anthropogenic influence, which in its scale went to the planetary level, but by force and speed ahead of the influence of natural factors [1, 2, 3]. The determination of biologically significant anthropogenic loads based on the reactions of living organisms and their groups is associated with bioindication. Such signs determine the suitability of bioindication for environmental research, expertise, prediction of behaviour, condition and development of ecosystems. Bioindication has several advantages over instrumental methods. It is distinguished by high efficiency, does not require high costs and allows to characterize the state of the environment over a long period of time. Environmental factors fairly strictly determine which organisms can live in this place, and which can not. Given this, we can use the inverse regularity and judge the physical environment of the organism that lives in it [4].

There are a number of bioindication methods of territories. Bioindication involves assessing the state of the environment with the help of living objects [5]. Living objects are usually cells, organisms, populations, communities. Their help can be evaluated as abiotic factors (temperature, humidity, acidity, salinity, content of pollutants, etc.), as well as biotic (the vitality of organisms, their populations and groups) [6].

The term "bioindication" is more often used in European scientific literature, though in the American one it is usually replaced by a similar content in the name "ecotoxicology".

Bioindication is based on the observation of the composition and number of species-indicators.

The method of bioindication is based on the selective biological accumulation of substances from the environment by organisms of plants and animals. The anthropogenic pollution of the soil and ponds with heavy metals, radionuclides and some organochlorine derivatives are considered to be the most dangerous for biotic communities since the accumulation of these substances in the living organisms (both the whole organism and its individual parts) violates normal metabolism, affects biochemical, cytological and physiological processes and generally worsens the condition and reproducibility of the population [7].

There are many ways of researching the human body and identifying certain environmental impacts on it. Most methods are indirect but mediated [8]. For example, the study of chemicals concentrations and doses of physical influences in the human environment. The maximum permissible concentration (MPC), maximum permissible dose (MPD), levels or doses are usually calculated using lethal doses (LD) of certain factors on the tested organisms, rats, mice, chickens, rabbits, etc. Usually, the boundary effects of the direction on the human body are calculated, and therefore do not reveal the objective impact of environmental factors on humans.

The most qualitative and accurate identification of environmental impacts can only be directed directly to a person, still this is impossible with the use of the "concept of MPC". For a thorough study of the impact of polluted and disturbed environments on humans, one should conduct a detailed study of all possible human health parameters: biochemical blood tests, changes in blood pressure, temperature, genetic effects, general well-being of a person, etc [9].

Environmental pollutants are found in all human bio substrates (blood, urine, breast milk, hair, teeth, bones, and exhaled air).

The greatest danger to child health is the chemical contaminants that cause mutagenicity, teratogenicity and carcinogenicity [10]. In this case, the impact of biosphere chemical contaminants on the body is extremely multifaceted and requires an integrated assessment (the individuality of toxic effects is impossible) [11].

An unpredictable set of pollutants (chemical, physical, biological, anthropogenic and informational) causes "integral environmental pressure" (IEP) on nature and man. Therefore, the functional health of the children's population should become the center of attention in modern conditions [12].

In general, the correlation between different (all) types of environmental impacts and human health violations in certain areas is extremely difficult, although it is an urgent task.

The functional health of certain age groups of the children's population should be in the center of attention, which becomes the "bioindicator" of the regional socio-ecological state.

"Functional health" implies the ability to adapt the organism to changing conditions of the external and internal environment. Today there is an understanding of adaptive dependence on the dynamic constancy of functionally vegetative homeostasis [13].

For this purpose, functional-vegetative diagnostics (FVD) of the children's population by the method of V. Makats is offered to be used since it allows to reveal indicators of variance of vegetative levels acting as integral bioindicators of internal homeostasis [14]. On this basis, an integral characteristic of the ecological state is formed and the levels (zones) of its ecological pressure are determined. The health of the children's population more objectively reflects the ecological changes of the territory, since children have neither occupational illnesses nor bad habits, they are fed by higher quality food, which allows to obtain more accurate information directly about the environmental impacts on the health of the population. Therefore, the study of the functional health of the children's population with the further analysis of medical and environmental impacts of the environment is an extremely urgent task [15, 16].

Materials and methods of the research. The essence of the bio-diagnostic method and bioindication of territories through the analysis of functional health of the population.

For researches, the method of "biogalvanization" of 24 symmetrical representative active functional zones (12 on the arms and 12 on the legs), which reflect the functional activity of the sympathetic and parasympathetic nervous system has been used. This allows to record changes in the activity of sites of the autonomic nervous system and to obtain systematic data that are subject to further complex analysis. The peculiarity of this method and device is the ability to record the activity of the VNS points of organs and systems of the body, in particular, the lungs (LU), the large (LI) and the small intestine (SI), the stomach (ST), the spleen and the pancreas (SP), Heart (HT), kidney (KI), bladder (BL), liver (LR), and the state lymphatic system (TE) separately. The symbols used correspond to the international classification of functional-vegetative systems (acupuncture channels). The obtained data are compared with the norm and it is concluded about the degree of deviation from it and the level of disturbance of functional health [13, 14].

The method of bio-diagnostics and devices for its implementation are officially authorized by the Ministry of Health of Ukraine "New medical technology and new methods of diagnosis" (minutes No. 5 dated December 25, 1991, No. 1.08-01 dated January 11, 1994)

and the Academic Council Ministry of Health of Ukraine (Duct No. 1.08-01 dated January 11, 1994).

Features of the device VITA 01 M:

1. external energy sources are not used for the device functioning;
2. the voltage in the closed circle does not exceed the levels of the membrane potentials (0,03 - 0,6 V);
3. due to the compactness and ergonomics of the device, it can be used for both stationary and expeditionary research.

The conducting of the experiment itself is carried out in the following stages [13, 14]:

1. preparation of the device VITA-01-M for diagnostics of functional and vegetative balance of the organism;
2. localization of representative and biologically active zones (BAZ), partially represented in Table 1;

Table 1

Representative active zones used for functional and vegetative diagnostics

Active zones	Topography of representative BAZ
H-1 (LU-9) Lungs	On the lumbar skin of the radial-wrist joint from the radius of the radial artery
H-2 (PC-7) Pericardium	In the middle of the lumbar fold of the radial wrist, between the muscle tendons
H-3 (HT-7) Heart	In the depression between petiolate and elbow bones on the lumbar spine of the radial wrist
H-4 (SI-4) Small intestine	On the inner (elbow) edge of the wrist in the gap between the base V of the kneecap and the wrists
H-5 (TE-4) Three heaters	On the back of the radial wrist in the depression between the tendons of the extensor of the fingers and the V finger
H-6 (LI-5) Large intestine	On the ray edge of the wrist, between the tendons of the thumb extensors
F-1 (SP-3) Spleen	On the medial side of the foot, in the depression behind and below the head I mold
F-2 (LR-3) Liver	On the back surface of the foot, in the narrowest place between the I and II molds
F-3 (KI-3) Kidneys	In the depression in the middle of the distance between the heel (Achilles) tendons and the medial tibia
F-4 (BL-65) Bladder	On the lateral side of the foot, in the depression behind and below the head of the V mold
F-5 (GB-40) Gall bladder	Side and bottom of the lateral side of the fibula, in the depression of the external side of the tendon of a long finger extensor
F-6 (ST-42) Stomach	At the very high part of the back of the feet between the joints II and III of the wedge bones and the II-III molds

3. preparation of diagnostic electrodes DE and AE: base electrode acceptor of electrons (AE) - a plate of special alloy, pre-coated with an oxide film (5x7 cm); diagnostic electrodes (DE - electron donors) in the form of a silvered vapor, which are disassembled in 1 cm diamonds and wrapped with foam Arubber gaskets;

4. fixation with a special pass through a wet pad (moistened with warm water or physiological solution) AE in the umbilical region (central mesogastric area (0-zone) with a tensile of average density to create stable test conditions. The latter are moistened with warm water. During testing DE at a right angle with a slight pressure (at the touch of a touch), simultaneously contact each pair of symmetric BAZs (left-right on each limb) for 1-4 seconds until stable values are obtained. Through each three contacts with BAZs electrodes are repeatedly wetted in a previously prepared solution.

NB H1-H6 representing biologically active zones (BAZ) on the hands, and F1-F6 - on the legs.

The data presented in Table 1 reveals only 12 key points that are important for the study of the major groups of the human organs, although the complete list of points contains over 200 active zones.

Results and Discussion. The main subject of the study of the ecological and medical zoning method is the complex state of the autonomic (vegetative) nervous system (VNS) of the child's organism and the analysis of the processes affecting it.

Indicators of the autonomic (vegetative) nervous system regulate all internal processes of an organism. There are functions of internal organs and systems, glands, blood and lymphatic vessels, smooth and partially transversely banded muscles, sensory organs. They provide the homeostasis of an organism, that is the relative dynamic constancy of the internal environment and the stability of its basic physiological functions (blood circulation, respiration, digestion, thermoregulation, metabolism, selection, reproduction, etc.). In addition, the autonomic nervous system performs adaptational trophic function - the regulation of the metabolism regarding the conditions of the environment.

There is a number of methods for studying individual indicators of the state of the autonomic nervous system. In particular, the method of orthostatic test, cardiointervalography, dermatography, the method of heart-to-heart reflex, galvanic reflex, etc. All of them are reduced to procedures or actions that allow characterizing the tone of sympathetic and parasympathetic innervation of a particular organ or system and do not reflect the vegetative state of the whole organism.

Till the recent days, vegetative anamnesis with the usage of questionnaire tables has been generally accepted as the means of integral evaluation of vegetative homeostasis. At the same time, historically preserved detached evaluation of sympathetic and parasympathetic reactions of the basic divisions of vegetative nervous system (VNS) contradicts contemporary ideas of their functional-dependent composition. Additionally, the complexity of the study of over-segmental and segmental levels of vegetative regulation restricts necessary information for clinicians. It is also necessary to remember about the heterogeneity of sympathetic and parasympathetic reactions, nonlinearity of parameters of vegetative status during the change of activity of one of the divisions of VNS and their dependency on a range of regulating factors. At the same time, it has been defined, that the indications of instrumental examination of VNS characterize only separate mechanisms of vegetative regulation.

Thus, table methods of vegetative diagnostics are subjective, though instrumental ones reflect the functional state of separate subsystems of VNS and separate mechanisms of vegetative regulations. That is why, in order to see the full picture, we need enormous, simultaneous and complex researches, during which, separate indications lose features of system evaluation of general vegetative homeostasis (VH).

Various organs and systems of the body are known to be associated with certain areas of the skin called acupuncture points. With the appearance of the smallest deviations in the systems of the body and organs, they react at the stage of functional disorders long before the occurrence of organic changes at the expense of meridional bonds. Such a reaction at acupuncture points is manifested in the form of a change in the magnitude of their magnetic field, temperature, electrical resistance, the rate of biochemical reactions, cellular composition in them as well as their size. Measuring the electrosurgical resistance in certain acupuncture points you can detect changes in the body still at the stage of functional disorders.

Each power system and body associated with its group of acupuncture points, among which there are so-called representative points (zones) that carry the maximum of reliable information about their system.

The analysis of possible ecological problems of the territory and its degree of ecological disturbance can be made due to the received data set on the state of functional health of the children's population of a certain territory and the averaged information on the deviation of the autonomic nervous system.

The data from the statistical observations of 18,650 children of different sex and age groups were used in order to determine of the normal values of vegetative states and

deviations from the norm. The analysis was not based on the absolute values of the indices, but the relative correlation of the total sympathetic and parasympathetic activity of the VNS.

Table 2

Gives the basic diagnostic norms of the functional state of individual systems

FVS	M, μA	min, μA	max, μA	FVS	M, μA	min, μA	max, μA
LU	10.1	7.3	12.9	BL	9.3	5.9	12.7
LI	7.8	5.3	10.2	KI	7.6	5.5	9.7
ST	7.7	5.0	10.3	PC	8.6	6.3	10.9
SP	9.5	6.1	13.1	TE	7.4	4.4	10.6
HT	9.3	5.4	13.1	GB	6.2	3.7	8.6
SI	9.0	7.0	11.0	LR	7.5	4.8	10.2

The array of experimental data is compared with the norms of the functional state after which the normative index of vegetative homeostasis is calculated for k-V (zone of FC - functional compensation zone).

The values can possibly be considered to be perfect if they recognize the equilibrium zone and the deviation in the area of parasympathetic activity or sympathetic activity indicates a deviation of functional health.

The vegetative coefficient of deviation (k-V) is used to determine the numerical value of the deviation. It is done with the use of the formula (1):

$$k-V = \sum X(SA) / \sum X(PSA), \quad (1)$$

where: $\sum X(SA)$ – the amount of diagnostic indicators that have a value higher than M;

$\sum X(PSA)$ – the sum of diagnostic indicators that have values lower than M;

M - diagnostic standard for a specific active zone, μA ;

X - measured value of the activity of a specific active zone, μA .

Vegetative coefficients (k-V) indicate the systemic ratio of "sympathetic / parasympathetic" activity.

Accordingly, when values of the deviation from the norm are more than one, sympathetic activity will be observed and, with values less than one, the parasympathetic activity takes place (Table 3).

For functional-ecological expertise (estimation) of settlements, indicators of vegetative dispersion (scattering of vegetative levels) are used (Yermishev O., 2017).

Table 3

Normative indices of vegetative homeostasis (vegetative dispersion) in k-V magnitude

Parasympathetic Activity (PSA)		Vegetative homeostasis			Sympathetic Activity (SA)	
		FC zone PSA	Equilibrium zone	FC zone SA		
considerable	expressed				expressed	considerable
$0,75 \leq$	0,76-0,86	0,87-0,94	0,95-1,05	1,06-1,13	1,14-1,25	$1,26 \geq$

Note: FC zone is a zone of functional compensation.

It is impossible to judge the ecological situation in the region according to individual indicators of the rejection of vegetative homeostasis. However, according to the group indicators (which are obtained by a large number of people), it is possible to draw conclusions regarding the level of environmental disturbance of the territories. To do this, Table 4 should be used. To determine the total percentage of homeostasis disturbances in the studied children in a particular territory is taken into account.

Table 4

The dependence of the functional ecological disturbance of the territory on the state of averaged deviations of the autonomic nervous system

Estimation of the tension (voltage) of the functional and ecological situation in the region	Number of violations of vegetative homeostasis in children (in%):		
	PSA zone	VE zone	SA zone
The zone of relative functional and environmental	15	70	15
Zone of increased functional and ecological attention	25	50	25
Zone with signs of functional and environmental voltage development	30	50	20
Zone with signs of the development of functional and environmental disaster	45	40	15
Functional and ecological disaster zone	65	25	10
Functional protection voltage zone - FVP	10	25	65

Note: PA - parasympathetic activity; VE - vegetative equilibrium; SA - sympathetic activity.

Practically, the type of complex deviation of functional health (sympathetic or parasympathetic) does not matter. In order to assess the disturbance of the territory, the relative value of the breach of vegetative homeostasis, which is defined as a percentage, is of particular importance.

The use of the data obtained to construct contamination maps and further analysis. For the effective use and analysis of the functional health data of the population of a certain territory, it is necessary to use the geographical binding of each case of the study.

It is difficult to deny the fact that the overwhelming majority of information on diseases has a geographic aspect and therefore it can be spatially analyzed and visualized in the form of maps, diagrams, graphs and drawings. There are powerful tools for effective analysis and visualization of spatial information such as geographic information systems (GIS) that not only allow the creation of electronic maps based on high-level databases but also by means of a comprehensive analysis of available spatial information solve problems of varying complexity.

These maps can be used to draw data on the definition of functional health and mapping of complex environmental pollution.

The mapping method can be used for in-depth analysis of various environmental parameters, which may include the condition of forest plantations, hunting teriophane, etc.

Conclusions

1. The given method is unique and allows to conduct ecological analysis of the territory with the help of the target group of organisms - a person.

2. The research method is non-invasive and low-cost, which allows conducting surveys of different age and sex groups and obtaining data with a minimum statistical error.

3. The given method does not consider such subjective indicators for different people as the MPC (maximum permissible concentration), MPD (maximum permissible dose), and therefore assesses the environmental impact on each subject objectively in its ability to withstand anthropogenic influences.

4. The given method is extremely promising in bioindication of territories contaminated with radionuclides, chemical means of plant protection, territories with contaminated objects of the hydrosphere and atmosphere, it allows to evaluate the total impact of all negative environmental factors on human health.
